

I am concerned that satellite radio is being attacked by local broadcasters. I don't think that it has to be that way- Times are changing, and satellite radio doesn't have to be threatening to smaller channels. There is abundant opportunity for growth and evolution. For example, newspaper companies nearly had a heart attack when the internet was first widely available, fearing that they would all soon be obsolete and a thing of the past. That, obviously, has not been the case. What has happened is that they saw what the internet had to offer and embraced it, seeing it as a tool rather than a potential enemy. So I don't think that technology needs to suffer in this instance. I think that local stations, be it for news, weather, or talk, will be able to find a way to adopt the new satellite technology for their advantage.
